ABSTRACT

Lichens not only play a major role in plant succession as pioneer species but also provide many ecosystem services. Various anthropogenic activities like habitat destruction, air pollution and over exploitation of lichens for economic uses seem to be the main threats for loss of lichen diversity. Hence, for *in situ* conservation of lichens, it is a prioritised need to document lichen species of a locality. Lichens of Assam are being extensively studied from a taxonomic point of view in recent years. An accurate and updated checklist of lichens is not available so far. Here we expand the knowledge of the lichen of Assam by critically surveyed the literatures and prepared an updated list of total 657 species of Assam.

INTRODUCTION

Lichens are well known as pioneer for establishing ecosystems and for many important ecosystem services they provide. Lichens are playing important role in monitoring pollution levels in developing areas. Nowadays, lichens are studied for their metabolic pathways that can sequester excess carbon as secondary com-pounds. The habitat loss, increasing air pollution, changes in the microclimatic conditions and uncontrolled harvest have become the major threats for loss of lichen diversity in India. Moreover, culture method of lichen proved to be uneconomical and re-introduction in to the field has been unsuccessful (Upreti and Nayaka, 2008). Hence, for conservation of lichens in the natural habitats, it is a prioritised need to document lichen species of a locality.

A good number of literatures on lichen diversity of various parts of Assam have been published but an updated and revised checklist of lichens of Assam is still lacking. This is why we critically surveyed the literatures on lichens of Assam and prepared an updated list of total 657 species of Assam. We believe that this list will be helpful to the researchers who are working in the field of Lichenology.

In Assam, Stirton (1881), a Scottish lichenologist, was the pioneer researcher who studied the lichens from tea plants and described 39 lichen species. Santesson (1952) reported a foliicolous species *Bullatina aspidota* (Vain.) Vézda & Poelt as *Gyalectidium aspidotum* (Vain.) R. Sant. and *Aulaxina uniseptata* R. Sant. from the state. Pant & Upreti (1993) reported *Diplochistis rampoddensis* (Nyl.) Zahlbr. from the state. Makhija and Patwardhan (1993) reported two species of lichens namely *Trypetelium rubrocinctum* Makhija & Patw. and *T. subnitidiusculum* Makhija & Patw. as new to science from the state. Divakar and Upreti (2005)

reported a good number of Parmelioid lichens from Assam. Rout *et al.* (2005) reported 24 species of lichens belonging to 12 genera and 8 families from different tree barks from NIT Campus, Silchar. Makhija and Adawadkar (2007) reported *Acanthothecis consocians* (Nyl.) Staiger & Kalb from the state. Makhija & Adawadkar (2007) recorded two species viz. *Graphis furcata* Fée and *G. malacodes* Nyl. from Assam which were new to India. Tewari and Upreti (2008) added *Platygramme australiensis* Staiger to the lichen flora of India from the state. Das (2008) reported 68 species belonging to 12 genera and 11 families from Cachar district of Assam. Sharma and Makhija (2009) reported two species namely *Diorygma junghuhnii* (Mont. & Bosch) Kalb, Staiger & Elix and *D. pruinatum* (Eschw.) Kalb, Staiger & Elix new to Assam and India as well. Jagadeesh Ram *et al.* (2009) reported a new species *Herpothallon isidiatum* Jagad. Ram & G.P. Sinha and a new record *Herpothallon granulare* (Sipman) Aptroot & Lücking for India from the state. Rout *et al.* (2010) enumerated 55 species of lichen belonging to 15 families and 25 genera from Innerline Reserve Forest of Southern Assam. Singha (2011), during doctoral research work, reported 71 species belonging to 32 genera and 15 families growing on betel nut tree from the Cachar district. Out of the 71 species, 5 species and one genus were reported as new to India. *Phyllopsora confusa* Swinscow & Krog, *Phyllopsora isidiolyta* (Vain.) Riddle and *Phyllopsora nemoralis* Timdal & Krog were reported as new to the lichen biota of India from Assam (Mishra *et al.*, 2011). *Fissurina indica* B.O. Saharma, Khadilkar & Makhija was described as new to science by Sharma *et al.* (2012) from Assam. Rout *et al.* (2012) studied the epiphytic lichen flora occurring on betel nut palm tree growing in an abandoned tea garden area of southern part of Assam. A total of 37 lichen species belonging to 16 genera and 10 families were

enumerated in their study. Das *et al.* (2013) reported 53 species belonging to 23 genera and 13 families from seventeen sites of Barak Valley. Daimari *et al.* (2014) studied the distribution of epiphytic lichens from three districts of Assam viz. Baksa, Kamrup and Sonitpur and enumerated 67 species belonging to 12 families and 24 genera. Of the total species, 41 lichen taxa were reported for the first time for Assam. Dey *et al.* (2015) reported 31 species belonging to 16 genera and 11 families of lichens from seven forest sites of Hojai sub-division of Nagaon district, Assam. Among the reported lichens, crustose and foliose lichens represented by 16 and 14 species respectively, while a single fruticose lichen *Ramalina hossei* Vain. was recorded for the first time from the area. Choudhury *et al.* (2016) reported 38 species of lichen belonging to 21 genera and 15 families from the archaeological monuments of Sonitpur district, out of which 6 species are new records for the state. Daimari *et al.* (2017) reported 25 species new to the lichen biota of Assam from Sonitpur district. These new records included 16 pyrenocarpous lichens with dominance of members from family Pyrenulaceae (11 spp.) followed by Physciaceae with five species. A total of 104 species of lichen were described by Dey (2016) from Nagaon district of Assam. Gupta and Sinha (2018) published a book in which they described a total of 300 lichen species based on own work and previous works on lichens of Assam such as Stirton (1881), Santesson (1952), Awasthi (1976), Patwardhan and Kulkarni (1977), Patwardhan and Nagarkar (1980), Nagarkar and Patwardhan (1981, 1982), Nagarkar *et al.* (1988), Makhija and Parwardhan (1993), Pant and Upreti (1993), Divakar and Upreti (2005), Rout *et al.* (2005, 2010), Awasthi (2007), Tewari and Upreti (2008), Mishra *et al.* (2011), Sharma *et al.* (2012), Das *et al.* (2013), Daimari *et al.* (2014), and Dey *et al.* (2015). Joshi *et al.* (2018) described *Ocellularia upretii* S. Joshi, Divakar, Lumbsch & Lücking as new to science from Cachar district. Gogoi *et al.* (2019) added 25 lichens to the lichen flora of Assam. Mishra *et al.* (2019) reported 98 lichens new to the lichen biota of Assam and a new record of basidi-lichen, *Multiclavula vernalis* (Schw.) Petersen to the lichen biota of India. Gupta *et al.* (2019) described a new species, *Enterographa assamica* Pooja Gupta, S. Joseph & G.P. Sinha from Cachar district of Assam. Gupta *et al.* (2020) reported 3 lichen species new to India from the state. Gogoi *et al.* (2020) reported *Bacidia pycnidiata* Czarnota & Coppins, *Malmidea nigromarginata* (Malme) Lücking & Breuss, *Porina malmei* P.M. McCarthy, *P. nuculastrum* (Müll. Arg.) R.C. Harris, *Pyrenula laetior* Müll. Arg. and *P. wrightii* (Müll. Arg.) R.C. Harris for the first time for India from the state. *Letrovittia assamana* S.Y. Kondr., GK. Mishra & D.K. Upreti is reported as new to science from Assam (Kondratyuk *et al.*, 2020). Ngangom *et al.* (2020) discovered a new lichen species (*Cratiria rubrum* Ngangom, Nayaka & Gogoi) from the state. Behera *et al.* (2021) have enumerated 138 species of lichens from five districts of Assam out of which 37 species are new for the state. Daimari *et al.* (2021) reported *Astrothelium alboverrucoides*, a new record to India and five new additions to the lichen biota of Assam. Recently, Islary *et al.* (2021) reported 26 lichens new to the lichen biota of Assam belonging to 14 genera, 9 families and one under Arthoniales from Ultapani Forest Range under Haltugaon Forest division of Kokrajhar district.

Above mentioned reports suggested that after the publication of 'Lichen flora of Assam' by Gupta and Sinha (2018) there are several explorations undertaken in different parts of the state and many more lichens are added to the list. These reports are scattered and there is a need for compilation of the same. The compilation resulted in a total of 657 species of lichen for the state of Assam.

METHODOLOGY

The publications containing information about the lichens of Assam were critically investigated and used for compiling the checklist. The taxa identified only up to genus are not considered for listing. Nomenclatures of lichens were updated following index fungorum (www.indexfungorum.org) and classification given by Wijayawardene *et al.* (2020) was followed to arrange the taxa within families.

RESULTS AND DISCUSSION

A total of 657 species of lichen under 146 genera and 41 families are listed below. This list indicated that the family Graphidaceae is represented by highest number of taxa i.e. 148 species where genus *Graphis* alone counts 70 species. The family Pyrenulaceae also comprises of a large number of species (84 spp.) with *Pyrenula* representing 72 species. Synonyms of 63 species have been updated with current scientific names (Table 1).

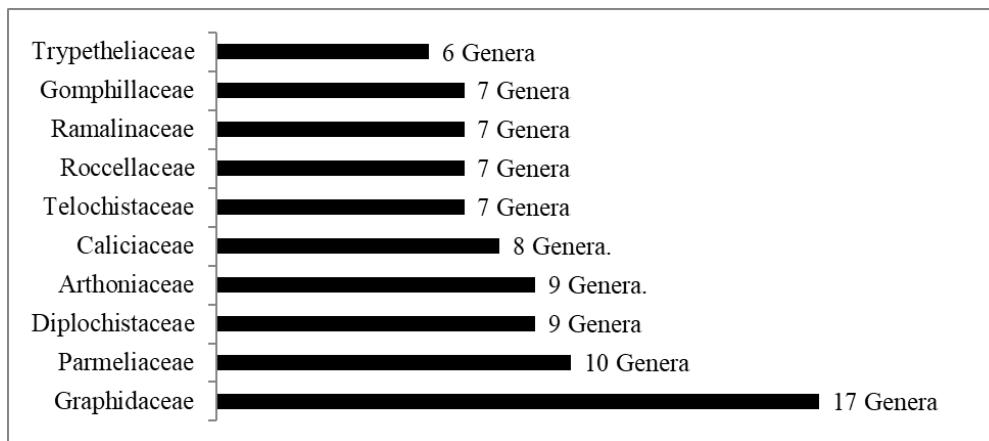

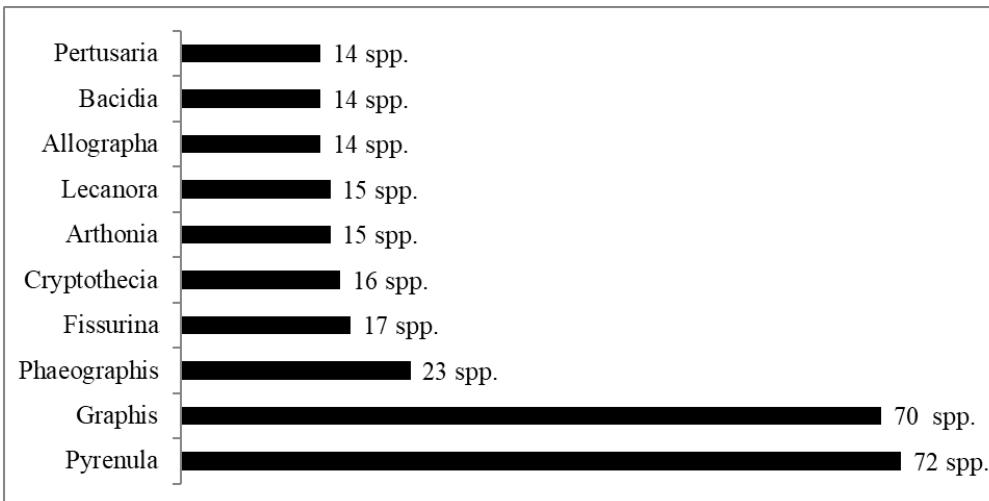

District-wise, highest number of lichens has been enumerated from Cachar district (214 spp.) followed by Nagaon district (203 spp.), Sonitpur district (181 spp.) and Dima Hasao district (143 spp.) (Das, 2008; Singha, 2011; Mishra *et al.* 2011, 2019; Daimari *et al.*, 2014; Dey, 2016; Gupta and Sinha, 2018; Gogoi *et al.* 2019, 2020; Ngangom *et al.*, 2020; Behera *et al.*, 2021). Detailed study of lichen diversity in most of the districts and protected areas of Assam is yet to be done.

The species are enlisted family-wise and the list follows the pattern; species name (in bold), locality and reference (in parenthesis).
